EXPERIMENT - 9

AI-Assisted Features and Built-in Analytics

Library Book Issue Management

Student Name	CALEB D
Register / Roll No.	241401016
Subject	Low-Code Application Development using Zoho Creator
Application	Library Book Issue Management
Platform	Zoho Creator
Record Date	16 October 2026

Aim

To explore AI-assisted features available in Zoho Creator and use built-in analytics to summarize library requests, while verifying numerical results against the source data.

Experiment overview

Exploration of Zia development assistance and library request analytics using the existing Development data and the approved Zoho Analytics integration.

Department of Computer Science and Business Systems

Rajalakshmi Engineering College

1. Scope and Prerequisites

The library application was built manually. This experiment examines Zia capabilities without asking it to rebuild or modify the application. Analytics uses the five existing records in Book_Issue_Request_Form; the separate subform lab records are excluded.

2. Zia Features Explored

Feature	Potential library use	Observed / evaluated
Build Agent and Create Form	Suggest a draft form or app structure from requirements.	Build Agent interface inspected; no build prompt submitted.
Next Field Suggestions	Suggest related fields during form design.	Feature shown in the Zia Development AI list.
Deluge Assistance	Help explain or draft validation logic.	Feature and provider assignment inspected; code still requires review and tests.
Deluge Zia Task / agents	Potential natural-language assistance in a workflow.	Feature list reviewed; no agent was deployed.
Prediction	Estimate a result from historical labelled records.	Suitability reviewed; five requests are insufficient for a useful model.

Operations > Zia showed Zoho GenAI configured. Availability in a feature list is not evidence that a prompt was executed or a prediction model was trained.

3. Responsible Use

Use synthetic examples for learning, review suggested fields and scripts, and test invalid inputs before accepting generated logic. Do not provide passwords, connection tokens or unnecessary member contact details in prompts.

241401016

4. Analytics Setup and Procedure

1. Opened Operations > System Integrations > Zoho Analytics.

2. Configured the included integration after the account owner approved it. The UI displayed Configured.

3. Selected Add New > Report > Pivot Chart, with Book_Issue_Request_Form as the source.

4. Named the chart Library_Member_Analytics.

5. Placed Member_Type on X-Axis and Member_Name on Y-Axis, using Count as the aggregation.

6. Generated the bar chart and compared the category counts with the five Development requests.

5. Expected and Observed Counts

Member type	Source records	Share of five requests
Faculty	1	20%
Staff	1	20%
Student	3	60%
Total	5	100%

The measure is request count grouped by member type, not a count of unique library members. Member_Name is mandatory, so each request contributes to Count. The two separate Library_Bulk_Request_Lab records do not contribute to this chart.

6. Interpretation

Students account for three of the five sample requests. This is a description of a small synthetic dataset, not a conclusion about campus demand. The existing Library_Dashboard provides complementary total, status, category and recent-request information.

Implementation Evidence

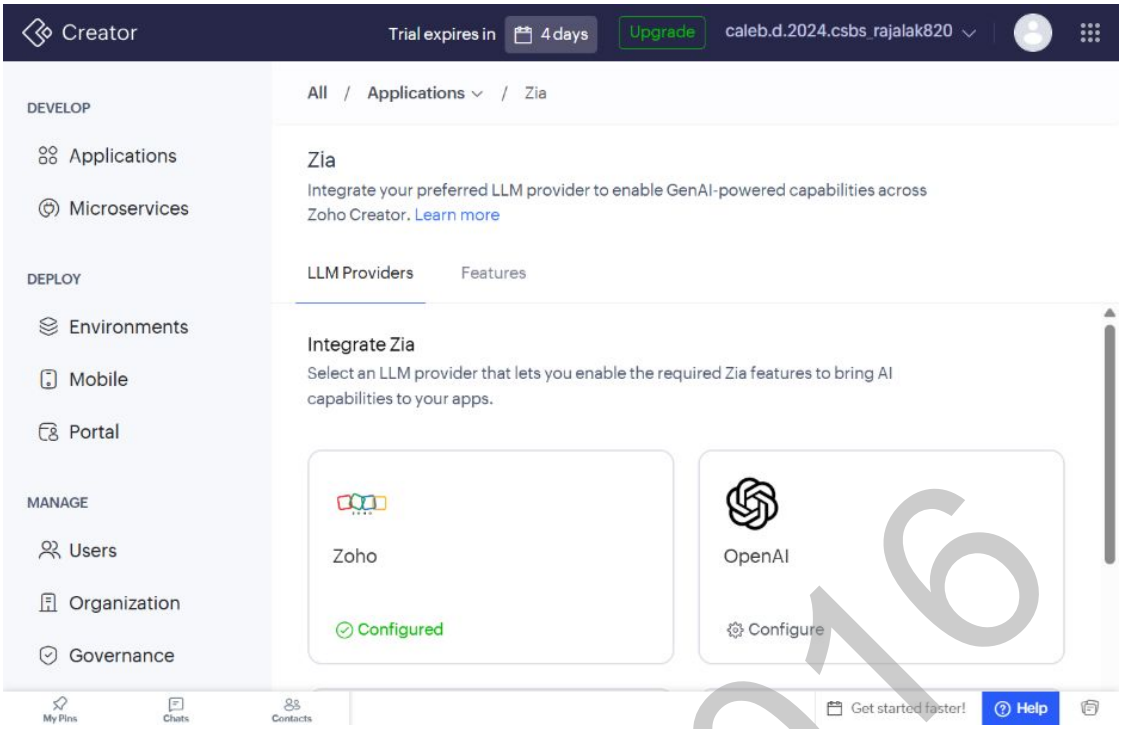

Figure 9.1. Operations > Zia shows the native Zoho provider configured.

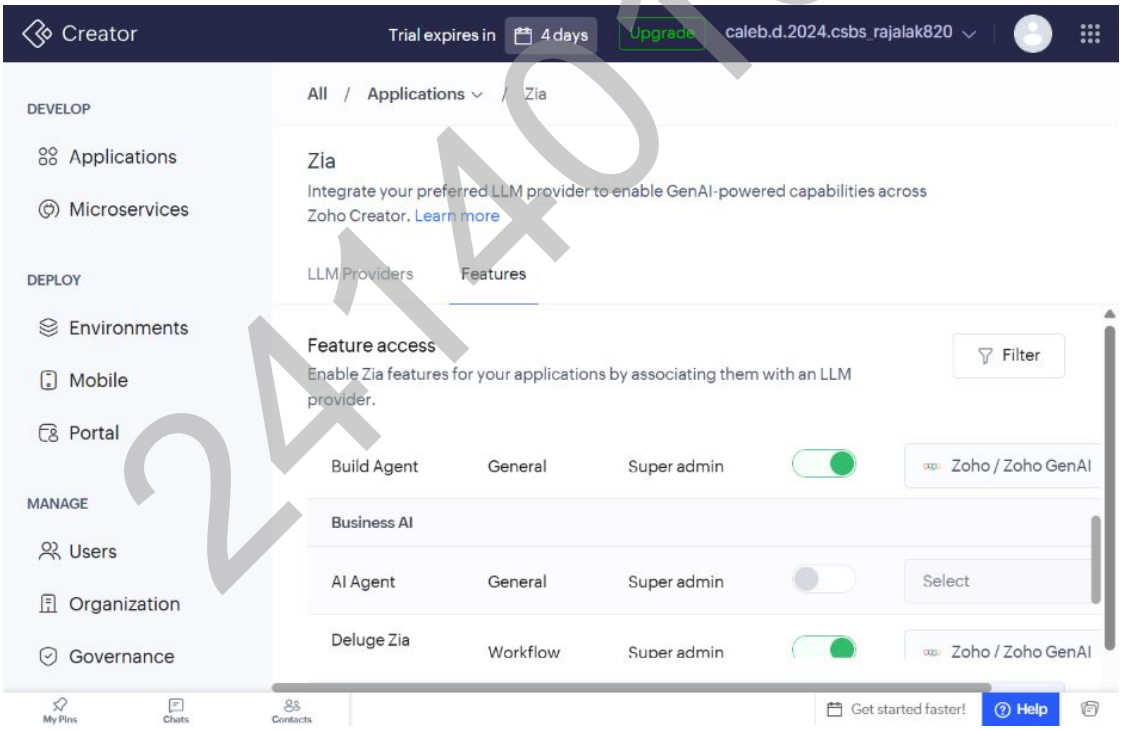

Figure 9.2. Actual Development AI feature list and provider assignments. No AI-generated application change is claimed.

241401016

Implementation Evidence

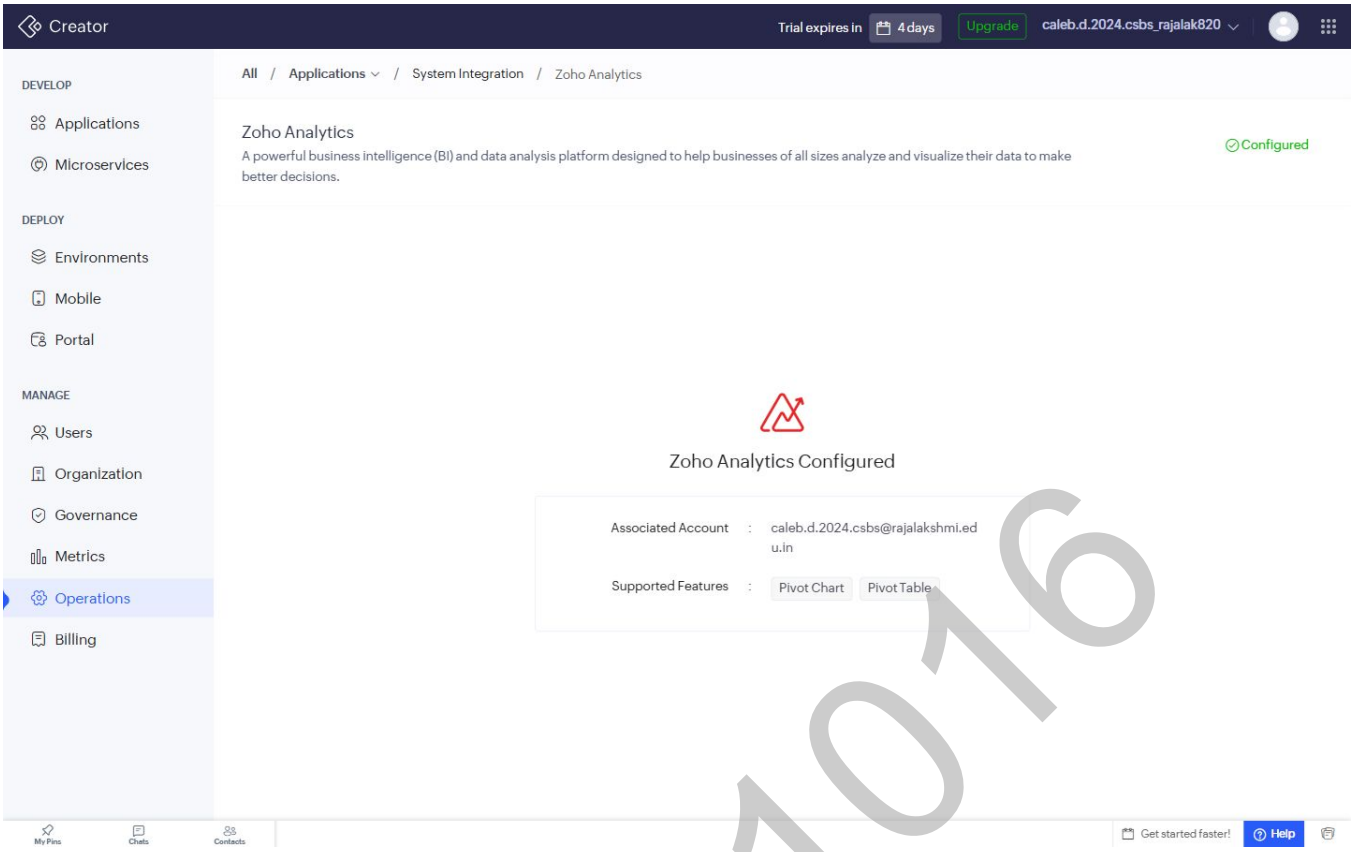

Figure 9.3. Approved Zoho Analytics system integration shows Configured, with Pivot Chart and Pivot Table support.

241401016

Implementation Evidence

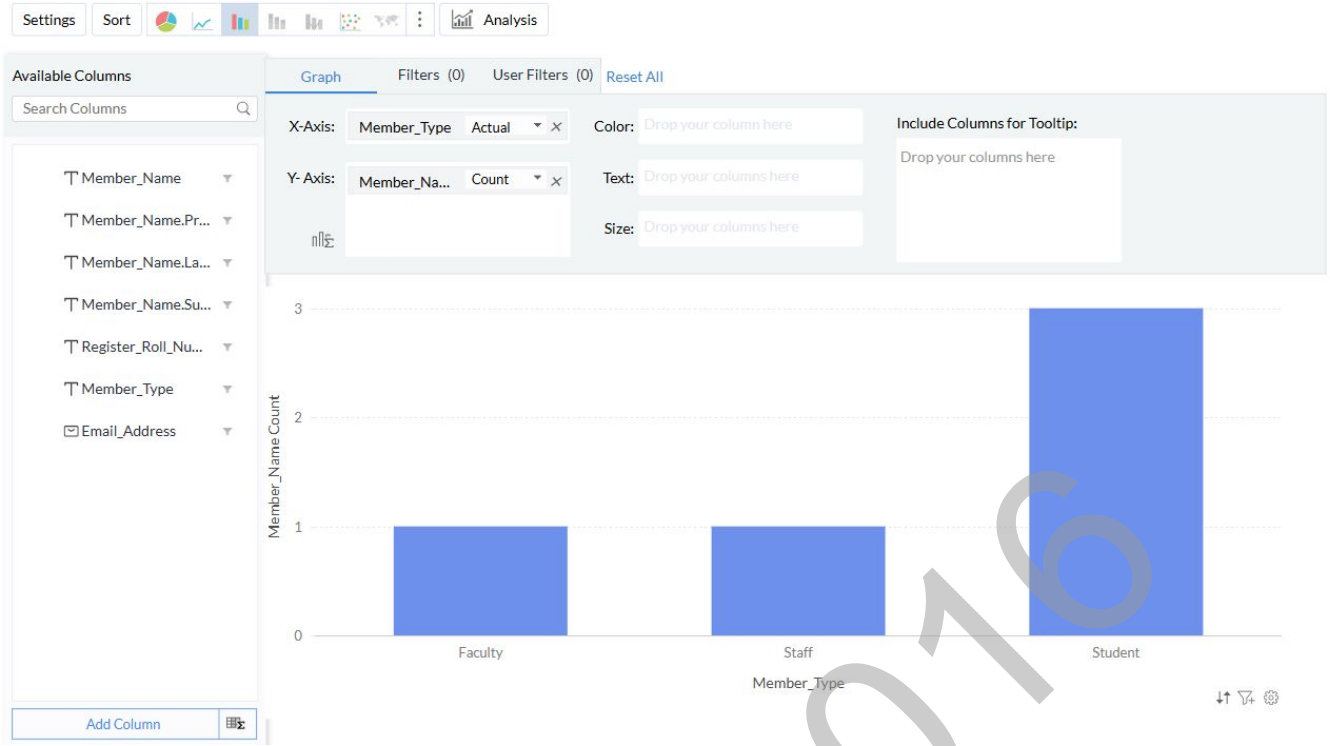

Figure 9.4. Actual generated Analytics chart preview: Faculty 1, Staff 1 and Student 3. Final persistence in Creator remains unverified.

241401016

7. Verification and Limitations

Check	Result
Native Zia provider and feature list	Inspected in the account UI.
Analytics integration	Configured with owner approval.
Chart aggregation	Generated preview matches 1 + 1 + 3 = 5 source requests.
Creator chart persistence	Manual final save remains to be verified.
AI-generated output	No prompt submitted; capability exploration only.
Prediction model	Not trained on the five-record sample.
Production release	No new package published for these experiments.

Zoho documents a minimum dataset requirement for prediction models that exceeds this five-record sample. An AI prediction experiment would need suitable labelled data and separate model evaluation. Creating meaningless extra records merely to pass a threshold would not demonstrate predictive quality.

8. Result

Zia development features were explored, the included Analytics integration was configured, and a member-type chart preview returned the expected request counts. The final Creator chart save is explicitly pending verification.
